SUMMARY

I am an SDE-2 at Instahyre, an India-based recruitment startup, with 4+ years of backend, full-stack, and infrastructure engineering experience. I lead a team of 6+ developers and own multiple business-critical systems including the company's CRM platform, deployment infrastructure, recruiter automation workflows, and lead-generation ecosystem. I have built and scaled systems serving 100M+ monthly API requests, 241M+ Elasticsearch documents, and over 2B+ database rows. My expertise spans distributed systems, search infrastructure, automation platforms, performance optimization.

SKILLS

Programming Languages:	Python, Javascript, C++, Go, Painless(ElasticSearch), Sql, Bash
Databases:	MySQL, Redis(Cache and Queue), MongoDB.
Backend:	Django, NodeJS and Tastypie.
Frontend:	Angular, React, HTML, CSS.
Observability:	AWS, Datadog (APM, dashboards), CloudWatch, Sentry, structured logging
Async/Messaging:	Celery, RabbitMQ, task queues, scheduled jobs

EXPERIENCE

1. INSTAHYRE

June 2022 - Present

Software Engineer-2 (SDE-II) (Team Lead)

Delhi, India

- Led a team of 5+ engineers, driving end-to-end development of scalable web applications, UI modernization, and system optimization.
- Designed and implemented a two-server architecture for the UI upgrade, enabling seamless migration from legacy AngularJS modules to modernized components without disrupting production traffic.
- Optimized multiple high-traffic APIs, Elasticsearch queries, and database operations, reducing p75 response latency by 45% and improving application responsiveness across recruiter and candidate workflows.
- I worked on optimizing our Elasticsearch indexing system by moving heavy indexing tasks to separate Celery queues and dedicated workers so that important async tasks were not getting delayed. This improved overall reliability and performance.
- Built a unified backend system integrating external tools for sales features, resulting in a 30% boost in lead conversion and a 20% reduction in deal creation time.
- Spearheaded the UI upgrade and modularization of the entire candidate-facing application, improving performance, maintainability, and user experience.
- Took ownership of the CRM project, managing deal activation workflows, outbound sales integrations, and sheet-based imports, enabling better sales automation and tracking.
- Developed sales and CSM dashboards to monitor company growth metrics, increasing visibility into team performance and business health.
- Implemented a dynamic recruiter leaderboard, tracking individual metrics and improving recruiter engagement. Integrated WhatsApp notification functionality for real-time recruiter updates.
- WhatsApp Feature: Revamped the WhatsApp notification feature on the website, enabling recruiters and candidates to receive real-time updates and alerts directly on WhatsApp.
- Built CRM sales-automation workflows in the codebase, automating deal-stage transitions, follow-up task scheduling, and reminder triggers via Celery; extended the pipeline to support outbound sales activities such as auto lead-assignment, and bulk sheet-based deal imports, streamlining daily sales operations.
- Performed code reviews, mentored team members, and monitored production bugs and issue resolution workflows.
- Designed and implemented a Redis-backed OTP verification flow, preventing premature database updates and ensuring secure phone number and email changes.
- Integrated a notification system to inform recruiters of their progress and ranking in the leaderboard project.

PROJECTS

1. Salesdhan (salesdhan.in)

- An engine that tracks real-time data about company metrics, funding, growth signals, job postings, and more then generates a score and notifies you when it's the ideal time to reach out.
- What it is:** SalesDhan also takes your pile of dead/cold leads, scores each one using AI and live web data, and gives your calling team a ranked list hottest leads at the top so they stop calling blind and start calling smart.
- It solves the following problem:** Every sales team has a graveyard of leads who said "follow up in 3 months" and were forgotten so this tool tell you what's the ideal time to reach out and also give fresh leads to contact.

2. Redis Clone in Python

Tech Stack: Python, TCP Sockets, Concurrency, Data Persistence

- Built a simplified Redis clone from scratch using Python, implementing core Redis commands like SET, GET, DEL, and PING.
- Developed a TCP-based server to handle client connections and process requests efficiently.
- Implemented in-memory key-value storage with concurrency-safe data access using threading and mutexes.
- Implemented data persistence and command handling logic, demonstrating understanding of distributed systems and caching principles.

EDUCATION

University of San Diego

Jul-2024 - Jun-2026

Master of Science, MS (Applied Artificial Intelligence)

Ajay Kumar Garg Engineering College

Jul-2018 - Jun-2022

Bachelor of Technology in Computer Science Technology (Cumulative GPA: 8.0/10)

Ghaziabad, India
